0 Introduction

0.1 Purpose of this Document

This document is provided as follows:

1. To national boards, to translate into their local language
2. To exam boards, to derive questions
3. To training providers, to produce courseware

1 Fundamentals of Testing

Learning objectives:

1.1 Test Objectives

1.2 Equivalence Partitioning

© Fictional Testing Board

1.1 Test Objectives

Typical test objectives are evaluating work products, triggering failures and finding defects, ensuring required coverage of a test object. Testing also reduces the level of risk of inadequate software quality.

© Fictional Testing Board

1.2 Equivalence Partitioning
Equivalence partitioning divides data into partitions such that all
elements of a given partition are expected to be processed in the same way.
1.2.1 Valid and Invalid Partitions
A partition containing valid values is called a valid partition;
boundary value analysis is often combined with this technique.

2 Risk Management

2.1 Product Risk Analysis

Risk level is determined by risk likelihood and risk impact.

The results of product risk analysis are used for the prioritization of tests and to decide the thoroughness of testing.
